

AMENDMENT

Amendments in the Claims:

Please amend the claims as follows (marked up version according to Revised Format):

1. (currently amended) A method of accessing data within ~~an electronic~~ a research system by a ~~system~~ an application external to the electronic system comprising the steps of:

- B1
- a. formatting a searchable database within the ~~electronic~~ research system into a directory tree structure, wherein the directory tree structure includes nodes comprising related data and branches comprising links between the nodes, wherein each related item of data is categorized by a navigation path through the directory tree structure and by one or more set parameters, each parameter is set with a corresponding value associated with the data item thereby forming a set parameter, wherein the parameters are specific to the node in which the related data is included; and
 - b. an external ~~system~~ application different than the ~~electronic~~ research system accessing one or more nodes within the directory tree structure and obtaining data from the one or more nodes by utilizing an applications programming interface (API) associated with the research system.

2. (original) The method as claimed in claim 1 wherein the applications programming interface accesses the one or more nodes within the directory tree structure using a query string defining a navigation path through the directory tree structure to access a specific node within the directory tree structure.

3. (original) The method as claimed in claim 2 wherein the related data is text, graphics, objects, links to other nodes within the directory tree structure, links to web sites external to the electronic system, or any combination thereof.

4. (original) The method as claimed in claim 1 wherein the searchable database is distributed into more than one physical location.

5. (original) The method as claimed in claim 1 wherein the step of accessing one or more nodes is performed by a server.
6. (original) The method as claimed in claim 5 further comprising the step of establishing an internet connection with the server to access the one or more nodes.
7. (original) The method as claimed in claim 6 wherein the internet connection is established with a computer system at a remote location from the server.
8. (original) The method as claimed in claim 1 wherein the step of accessing one or more nodes is performed utilizing a selective one or more search methodologies including keyword search, hierarchical tree search, dichotomous key search, and parametric search.
9. (currently amended) A research system for providing access to a searchable database by a system an application external to the research system comprising:
- a. means for formatting the searchable database into a directory tree structure, wherein the directory tree structure includes nodes comprising related data and branches comprising links between the nodes, wherein each related item of data is categorized by a navigation path through the directory tree structure and by one or more set parameters, each parameter is set with a corresponding value associated with the data item thereby forming a set parameter, wherein the parameters are specific to the node in which the related data is included; and
 - b. means for an external system application different than the electronic research system accessing one or more nodes within the directory tree structure and obtaining data from the one or more nodes by utilizing an applications programming interface (API) associated with the research system.
10. (original) The research system as claimed in claim 9 wherein the applications programming interface accesses the one or more nodes within the directory tree structure using a query string defining a navigation path through the directory tree structure to access a specific node within the directory tree structure.

11. (original) The research system as claimed in claim 10 wherein the related data is text, graphics, objects, links to other nodes within the directory tree structure, links to web sites external to the electronic system, or any combination thereof.
12. (original) The research system as claimed in claim 9 wherein the searchable database is distributed into more than one physical location.
13. (original) The research system as claimed in claim 9 wherein the means for accessing one or more nodes is performed by a server.
14. (original) The research system as claimed in claim 13 further comprising means for establishing an internet connection with the server to access the one or more nodes.
15. (original) The research system as claimed in claim 14 wherein the internet connection is established with a computer system at a remote location from the server.
16. (original) The research system as claimed in claim 9 wherein the means for accessing one or more nodes is performed utilizing a selective one or more search methodologies including keyword search, hierarchical search, dichotomous key search, and parametric search.
17. (currently amended) A research system for providing access to a searchable database by a ~~system~~ an application external to the research system comprising a research server configured to format the searchable database into a directory tree structure, wherein the directory tree structure includes nodes comprising related data and branches comprising links between the nodes, wherein each related item of data is categorized by a navigation path through the directory tree structure and by one or more ~~set~~ parameters, each parameter is set with a corresponding value associated with the data item thereby forming a set parameter, wherein the parameters are specific to the node in which the related data is included, and an external ~~system~~ application different than the ~~electronic~~ research system to access one or more nodes within the directory tree structure and to obtain data from the one or more nodes by utilizing an applications programming interface (API) associated with the research system.

18. (original) The research system as claimed in claim 17 wherein the applications programming interface utilizes a query string to communicate with the research server, wherein the query string defines a navigation path through the directory tree structure to access a specific node within the directory tree structure.

19. (original) The research system as claimed in claim 18 wherein the related data is text, graphics, objects, links to other nodes within the directory tree structure, links to web sites external to the electronic system, or any combination thereof.

20. (original) The research system as claimed in claim 17 wherein the searchable database is distributed into more than one physical location.

21. (original) The research system as claimed in claim 20 further comprising an interface circuit coupled to the research server to establish a connection with a computer system.

22. (original) The research system as claimed in claim 21 wherein the connection is established with the computer system at a remote location from the interface circuit.

23. (original) The research system as claimed in claim 22 wherein the connection is established with the remote computer system and the interface circuit over the internet to allow users to access the one or more nodes and to obtain data from the one or more nodes.

24. (original) The research system as claimed in claim 17 wherein the research server accesses the one or more nodes by utilizing a selective one or more search methodologies including keyword search, hierarchical search, dichotomous key search, and parametric search.

25. (currently amended) A network of devices for providing access to a searchable database by ~~a system~~ an application external to the research system comprising:

- a. one or more computer systems configured to establish a connection with other systems; and
- b. a research server coupled to the one or more computer systems to format the searchable database into a directory tree structure, wherein the directory tree structure includes nodes comprising related data and branches comprising links

between the nodes, wherein each related item of data is categorized by a navigation path through the directory tree structure and by one or more ~~set~~ parameters, each parameter is set with a corresponding value associated with the data item thereby forming a set parameter, wherein the parameters are specific to the node in which the related data is included, and an external ~~system~~ application different than the ~~electronic~~ research system to access one or more nodes within the directory tree structure and to obtain data from the one or more nodes by utilizing an applications programming interface (API) associated with the research system.

26. (original) The network of devices as claimed in claim 25 wherein the applications programming interface utilizes a query string to communicate with the research server, wherein the query string defines a navigation path through the directory tree structure to access a specific node within the directory tree structure.
27. (original) The network of devices as claimed in claim 26 wherein the related data is text, graphics, objects, links to other nodes within the directory tree structure, links to web sites external to the electronic system, or any combination thereof.
28. (original) The network of devices as claimed in claim 25 wherein the searchable database is distributed into more than one physical location.
29. (original) The network of devices as claimed in claim 25 wherein the one or more computer systems and the research server are coupled together over the internet to allow users to access the one or more nodes and to obtain data from the one or more nodes.
30. (original) The network of devices as claimed in claim 25 wherein the research server accesses the one or more nodes by utilizing a selective one or more search methodologies including keyword search, hierarchical search, dichotomous key search, and parametric search.

31. (currently amended) A method of accessing data within ~~an electronic~~ a research system by a ~~system~~ an application external to the ~~electronic research~~ system comprising the steps of:

- 
- a. formatting a searchable database within the ~~electronic research~~ system into a directory tree structure, wherein the directory tree structure includes nodes comprising related data and branches comprising links between the nodes, wherein each related item of data is categorized by a navigation path through the directory tree structure and by one or more ~~set~~ parameters, each parameter is set with a corresponding value associated with the data item thereby forming a set parameter, wherein the parameters are specific to the node in which the related data is included; and
 - b. an external ~~system~~ application different than the ~~electronic research~~ system accessing one or more nodes within the directory tree structure and obtaining data from the one or more nodes by utilizing an applications programming interface (API) associated with the research system, wherein the applications programming interface accesses the one or more nodes within the directory tree structure using a query string defining a navigation path through the directory tree structure to access a specific node within the directory tree structure.

32. (currently amended) A method of accessing data within ~~an electronic~~ a research system by a ~~system~~ an application external to the ~~electronic research~~ system comprising the steps of:

- a. formatting a searchable database within the electronic system into a directory tree structure, wherein the directory tree structure includes nodes comprising related data and branches comprising links between the nodes, wherein each related item of data is categorized by a navigation path through the directory tree structure and by one or more ~~set~~ parameters, each parameter is set with a corresponding value associated with the data item thereby forming a set parameter, wherein the parameters are specific to the node in which the related data is included; and
- b. an external ~~system~~ application different than the ~~electronic research~~ system accessing one or more nodes within the directory tree structure and obtaining data from the one or more nodes by utilizing an applications programming interface (API) associated with the research system, wherein accessing one or more nodes is performed utilizing a ~~selective one or more search methodologies including keyword search, hierarchical search, dichotomous key search, and parametric~~

bl
search search module, the search module includes a keyword search capability, a hierarchical search capability, a dichotomous key search capability, and a parametric search capability.
